

PERMAVOID 150 CAPILLARY CYLINDER

Where the Permavoid units are very suitable for water storage and conveyance, the Capillary Cylinders are the key component in transporting water from the units back to soil and plants, or capillary irrigated layers on top. These cylinders have been specifically designed for the purpose of capillary transport of water, with a capacity of each

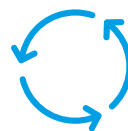

cylinder that outperforms even the highest plant evaporation rates many times over. The fibres will last a lifetime. For the Permavoid 150 unit, each cone consists of two parts, set on top of each other in one or both the centrally placed vertical columns of the unit to create capillary irrigation.
